Entity Relationship Diagrams

Learning Objectives

- To know what an ERD is and why they are used.
- To create a new Entity Relationship Diagram.
- To reverse engineer a diagram from existing tables.
- To consider the relationships between tables in an ERD.

What is an ERD?

An Entity Relationship Diagram is a type of flowchart that illustrates how “entities” such as people, objects or concepts relate to each other within a system.

ERDs are used to design or debug relational databases and a set of **symbols** and **connecting lines** to depict the interconnectedness of entities, relationships and their attributes.

There are two ways to use ERDs...

Method 1

From a database to a diagram

Method 2

Create a diagram which will give us the SQL

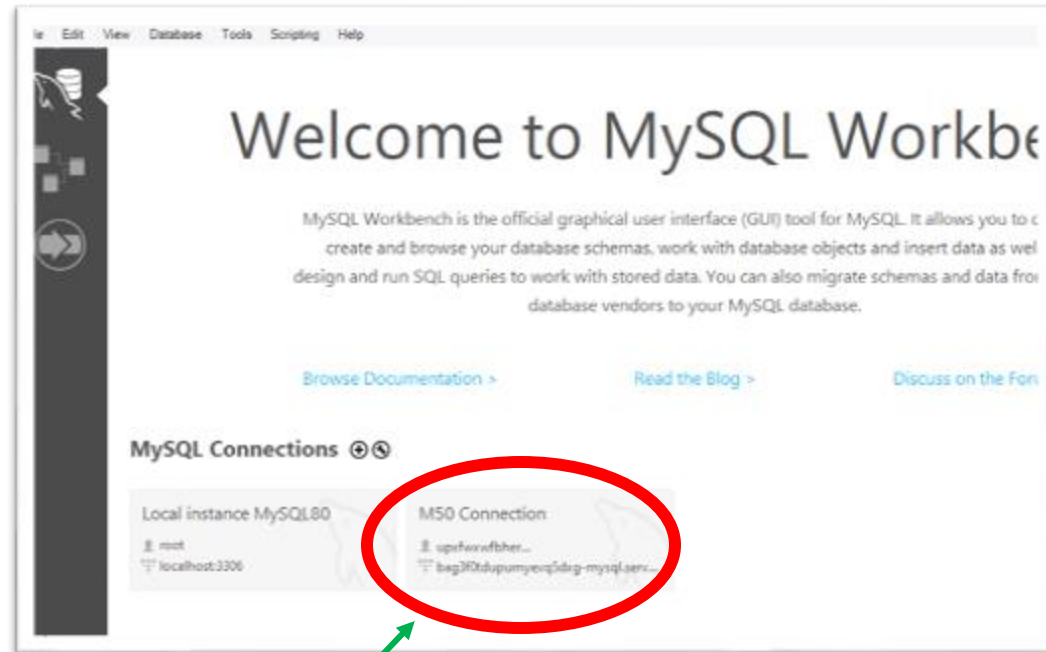

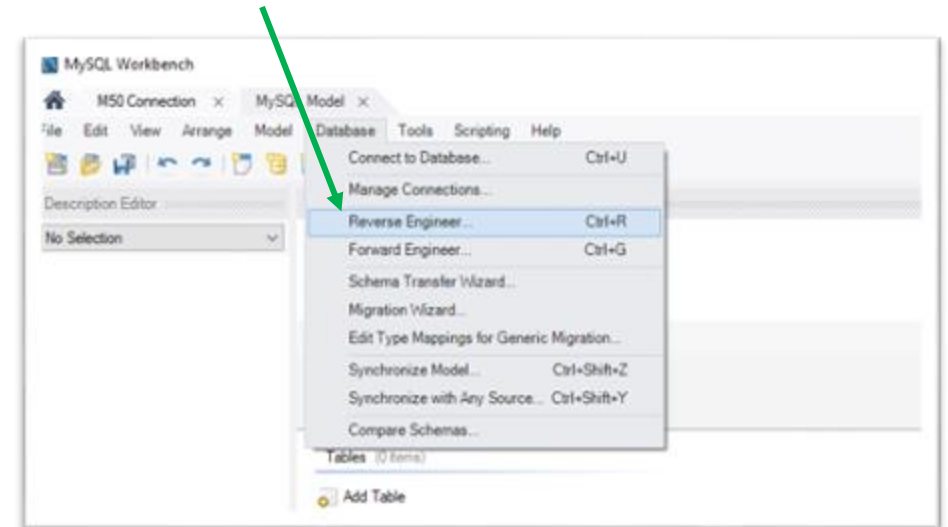

SQL

Method 1

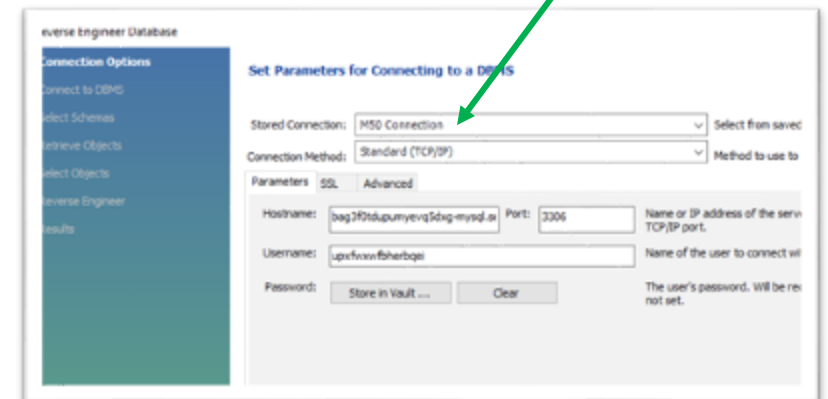

From a database to a diagram.

Click 'Database', then
'Reverse Engineer'

Select your database

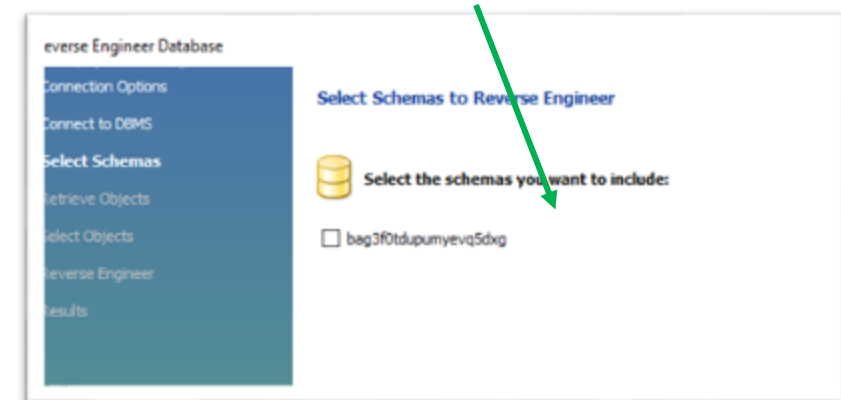

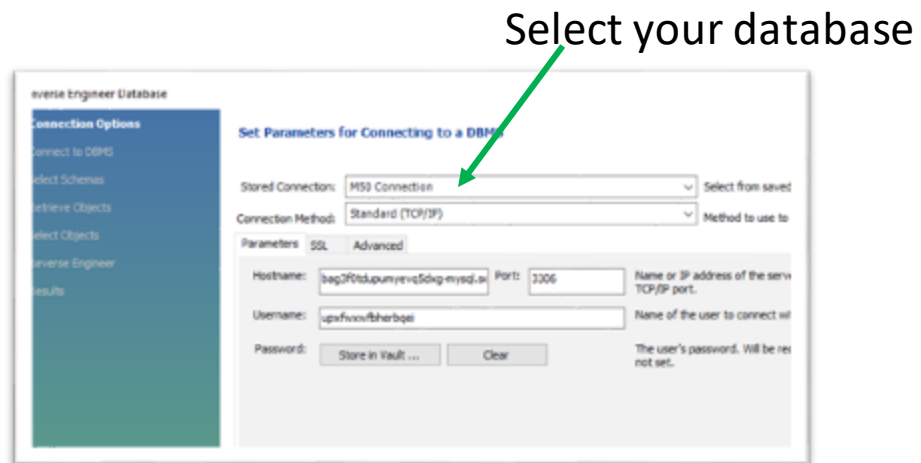

Select your database

Method 1

From a database to a diagram.

After it has fetched your database information, click on the schema to include in the diagram.

Select the tables to import on the diagram

Method 1

From a database to a diagram.

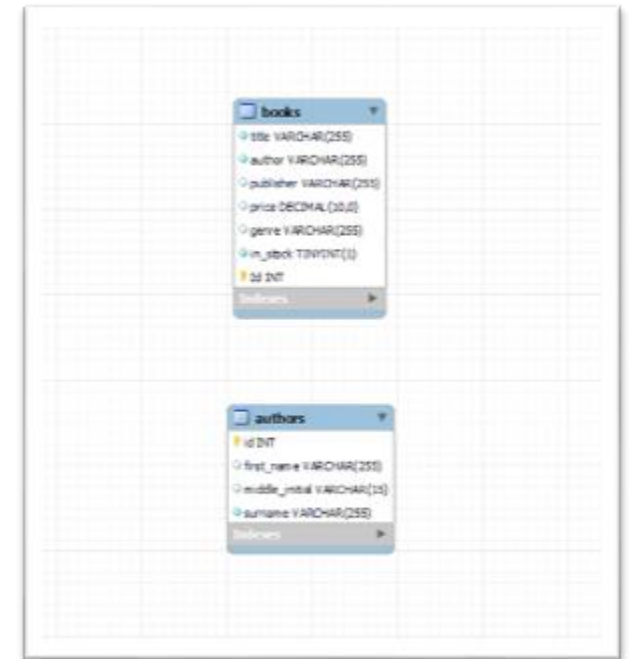

A new tab appears called **EER Diagram**.

The tables and any connecting lines have been organised for you.

Each table shows the column names with icons to represent the different properties

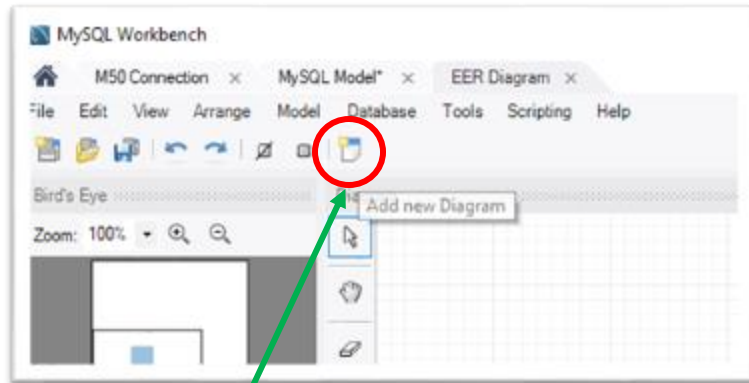

This is your diagram

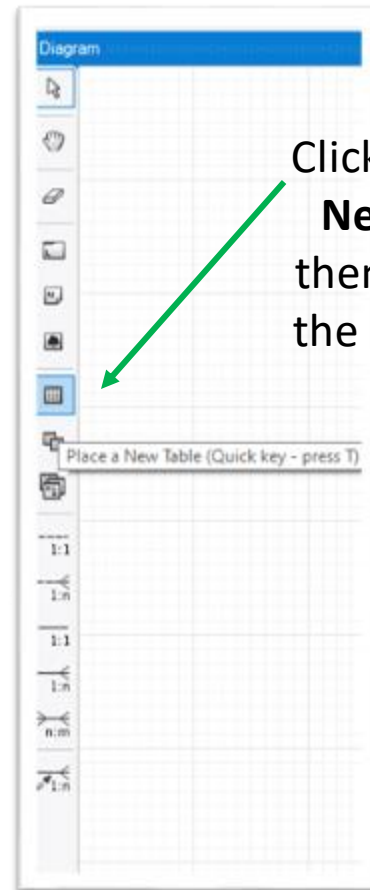

Method 2

Create a diagram from scratch.

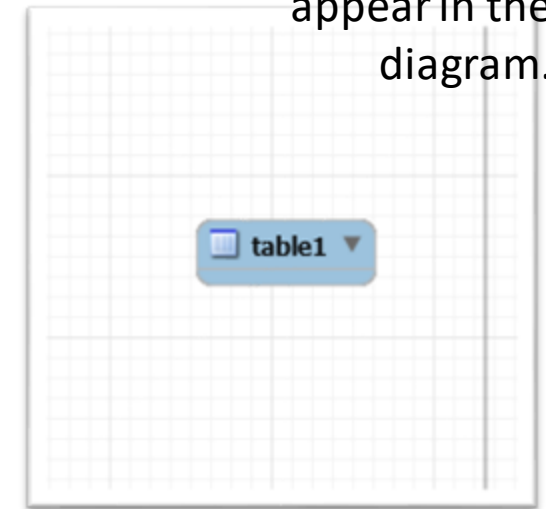

SQL

Click on the 'Add New Diagram' button.

Click '**Place a New Table**' then click on the diagram.

Double-click on the table to start adding your table columns.

Method 2

Create a diagram from scratch.

SQL

After double-clicking on the table diagram, you can then add some columns – one-by-one. As you did earlier, give the column a name, datatype and any constraints.

Column Name	Datatype	PK	NN	UQ	B	UN	ZF	AI	G	Default/Expression
		<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	

Table Name: Schema:

Column Name: Data Type:

Charset/Collation:

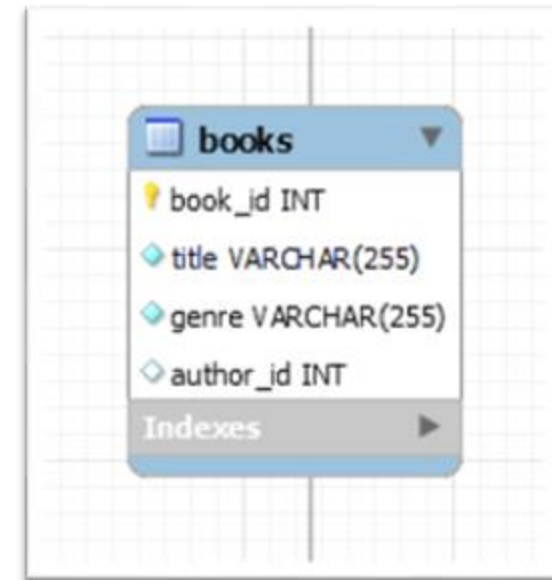

Default:

Comments:

Storage: ☐ Virtual ☐ Stored

☐ Primary Key ☐ Not Null ☐ Unique

☐ Binary ☐ Unsigned ☐ Zero Fill

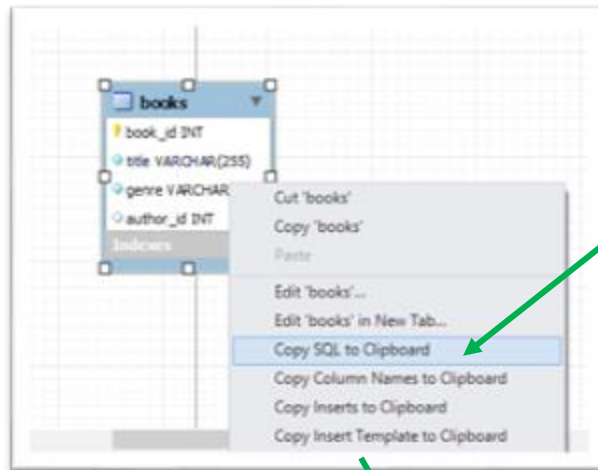

Add in the rest of your column names and details.

Show how to add a foreign key(s) to a table
using ERDiagrams??????

Method 2

Create a diagram from scratch.

SQL

When your table design is done, you can right-click on it to copy the SQL commands to create it.

```
Untitled - Notepad
File Edit Format View Help
CREATE TABLE IF NOT EXISTS `bag3f0tdupmyevq5dxg`.`books` (
  `book_id` INT UNSIGNED NOT NULL AUTO_INCREMENT,
  `title` VARCHAR(255) NOT NULL,
  `genre` VARCHAR(255) NOT NULL,
  `author_id` INT NULL,
  PRIMARY KEY (`book_id`))
ENGINE = InnoDB
```

To save time with INSERT statements, you can copy this Template.

```
Untitled - Notepad
File Edit Format View Help
INSERT INTO `bag3f0tdupmyevq5dxg`.`books` (`book_id`, `title`, `genre`,
`author_id`)
VALUES (NULL, NULL, NULL, NULL);
```

Activity 1

Experiment with the 'Reverse Engineer' features of MySQL Workbench to create your ER Diagram from your own tables from yesterday.

Use the table Diagrams to create the SQL statements that would be helpful when writing SQL Queries.

Stretch

Workbench has a 'Forward Engineer' feature which allows us to create a database for tables in a diagram. Investigate how this works by creating some tables using ERD, then selecting the Database --> Forward Engineer option.

Learning Objectives

- To know what an ERD is and why they are used.
- To create a new Entity Relationship Diagram.
- To reverse engineer a diagram from existing tables.
- To consider the relationships between tables in an ERD.
